

Next-Generation Soil Conditioning System For Golf Courses

A sub-surface Aeration & Water Evacuation solution

SubAir[®]

Transform your Golf course to a Championship course!

Maintaining a Golf course in world-class condition is one of the toughest challenges for any curator. Black layer, variation in temperature and moisture, thatch, disease are just some of the problems.

Here's finally a solution!

Introducing SubAir® - a patented soil conditioning technology from USA - a proven success in close to 500 golf courses across the world, now in India.

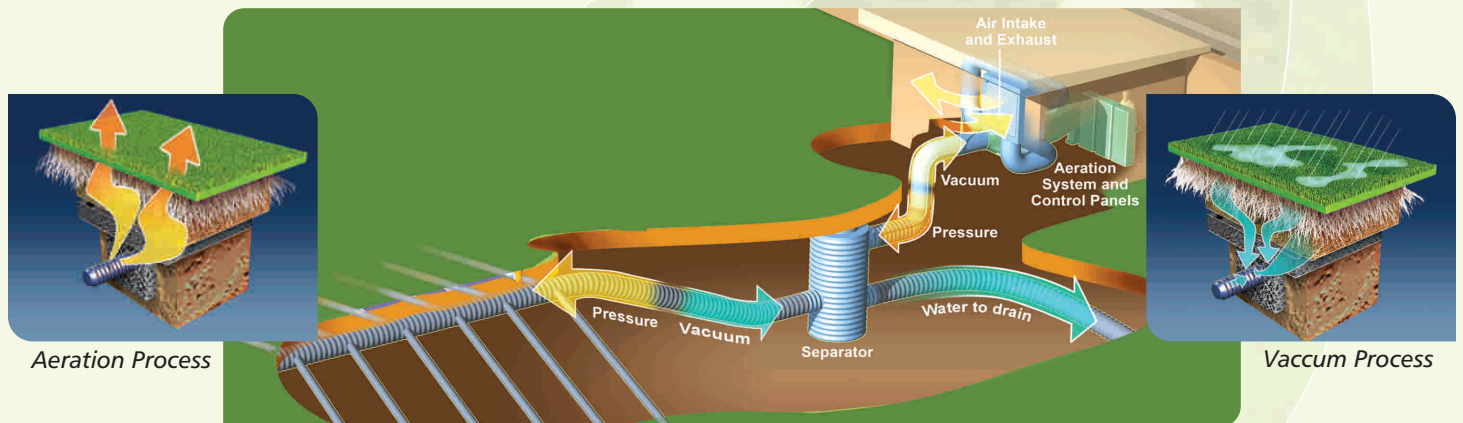

75% of Turf problems are Sub-surface...yet 75% of the remedies are applied above the surface!

How SubAir® Works

SubAir® provides both pressurized aeration and vacuum powered drainage for the turf. It enables air-exchange in the root zone to promote deeper roots and healthier grass thereby improving playability. The result is world-class turf.

Significant Benefits

- ◆ Aeration / Removal of Harmful gases.
- ◆ Thatch / Black Layer Removal.
- ◆ Increased Root mass and depth.
- ◆ Improved Disease resistance.
- ◆ Grass Temperature Moderation.
- ◆ Rapid water evacuation.

"The SubAir® system allows us to pull water out of the greens when we get heavy rains and also allows us to blow air up through the green profile, to help cool down the soil in the greens during the summer"

Mike Guiffre, Director of Golf and Grounds Maintenance
Congressional Country Club, Bethesda, MD, USA

TurfBreeze® - Another product from SubAir® promotes surface aeration through air circulation. This results in lowering of the temperature by 10°F and a healthier turf environment.

Client List
